About Design House

Design House is an experienced interior design, fit-out and refurbishment company with a passion for delivering exceptional interior transformations. Since starting out the very first project, our commitment to quality has seen us grow considerably, and we now managing projects in various types and field

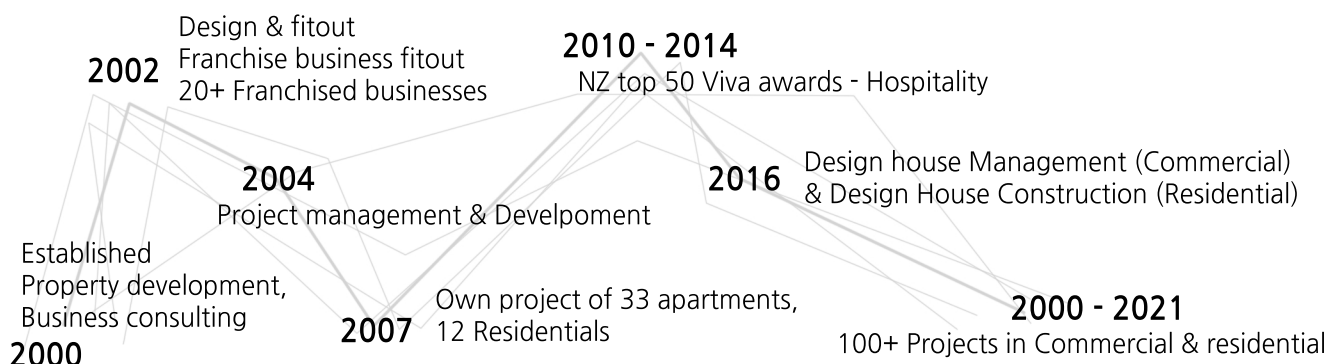

Over our 20+ year history, we have carried out fit-outs and refurbishments for clients across a range of sectors, including commercial, residential, office, mall, leisure & retail and industrial & warehouse. In doing so, we have built an extensive project portfolio and a dedicated client base throughout Auckland, New Zealand.

We pride ourselves on being proactive, reliable and efficient, no matter what elements of the service you need. Whether you require service on full design work, consent, every process related to fit out and construction, our hands-on approach will ensure your project is delivered on time, on budget and with minimal disruption.

We also understand what it takes to grow a business, and this is something that helps us to connect with clients and deliver successful projects. Through offering technical knowledge and creative solutions, we ensure that all clients receive a design that will improve working practices and put them on the path towards a bright future.

Furthermore, we always maintain clear lines of communication, making for proficient and transparent service. This approach will also ensure your project stays true to your remit, helping you to achieve your long-term goals.

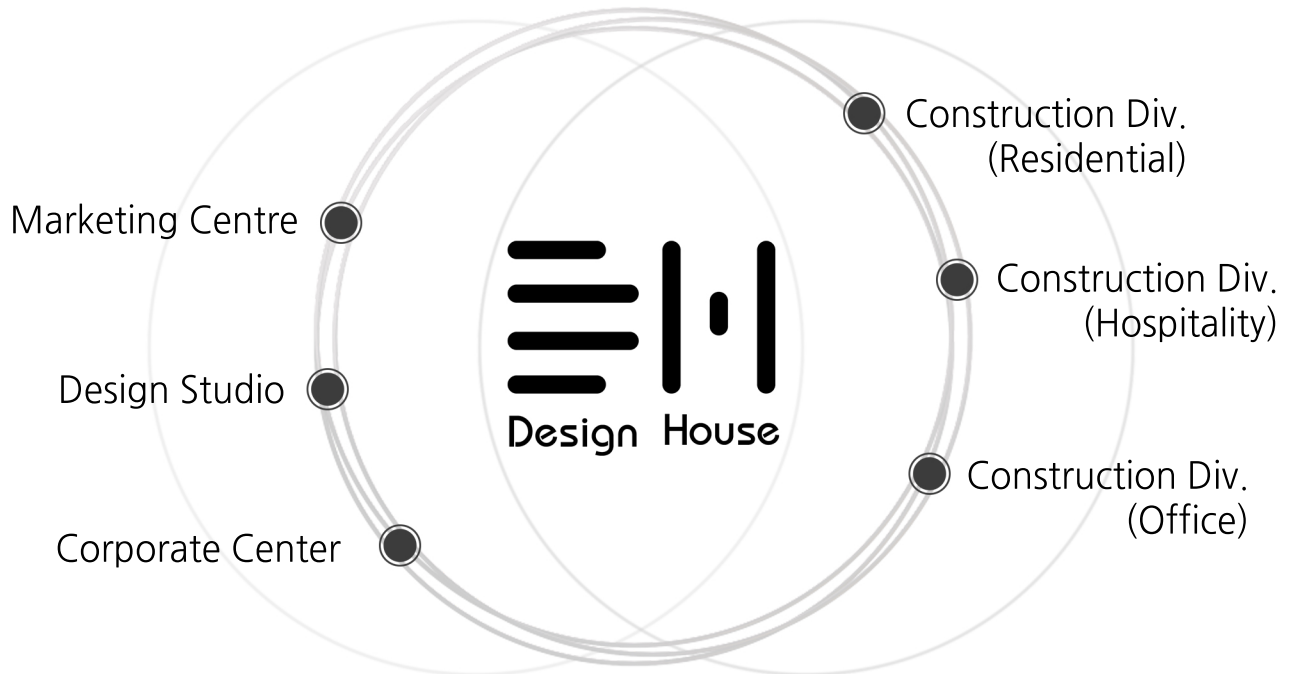

Company history

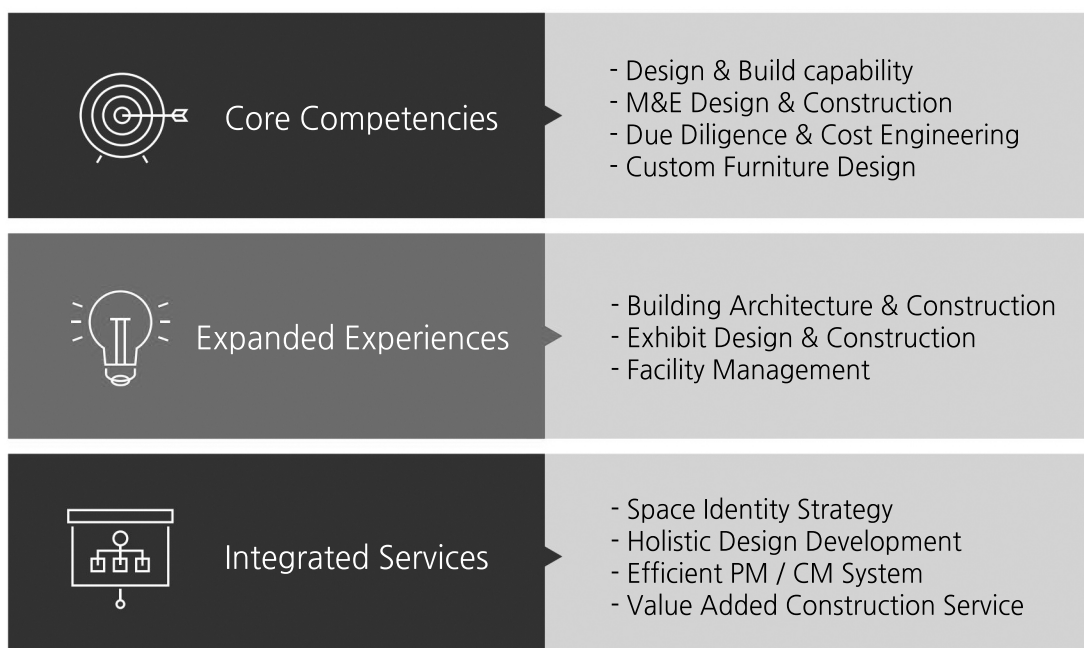

Design House is company of professionals that put value creation as its top priority

Process

Conception 1

Planning and development, sometimes called project conception, is the very beginning of the construction process.

Conception is the stage where ideas are at their most fluid, but it also creates the foundation of the construction process.

Everything must be done with care to ensure a successful build later.

Parts of this step include finding a property for the build, initial concept pre-designs, and choosing an architect and possibly a general contractor.

The design process is where the impossible dreams of client meet what is actually doable.

Once we have managed to be realistic, plans or a design get drawn up. For the first time, you get to see what the project will look like when it is finished after you meet one more round of challenges.

2 Design

Once we've completed bending the rules of reality to bring client's dreams to life in the final plans, bid materials are put together.

Those bid materials are sets of information called contractor documents (sometimes construction documents or working drawings) that give contractors and construction companies the information they need to bid on the project.

3 Preconstruction

This is the "getting ready to start building" phase.

We as general contractor will appoint project management team

Contract administrator

Makes sure that the project manager and superintendent have the right information about the construction contract.

Project Manager

The head of the construction project management team. Could be called a construction project manager or construction manager.

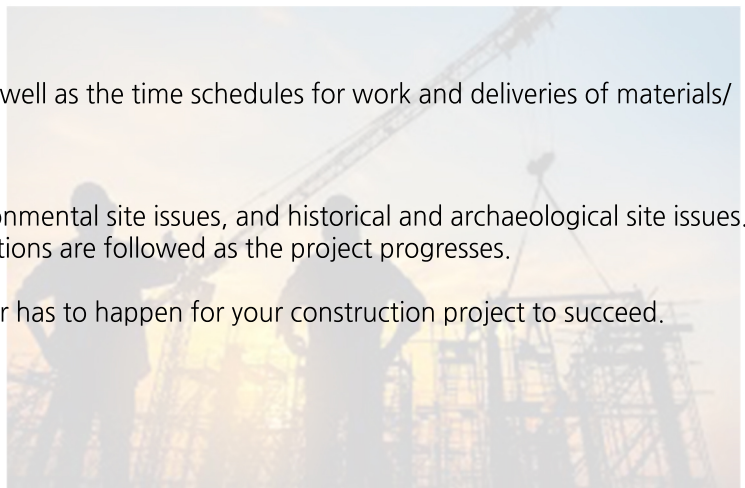

Superintendent

Coordinates all construction activities on-site as well as the time schedules for work and deliveries of materials/equipment.

Field Engineer

Manages and coordinates site inspection, environmental site issues, and historical and archaeological site issues. The field engineer makes sure safety and regulations are followed as the project progresses.

Keeping the project management team together has to happen for your construction project to succeed.

4

Procurement

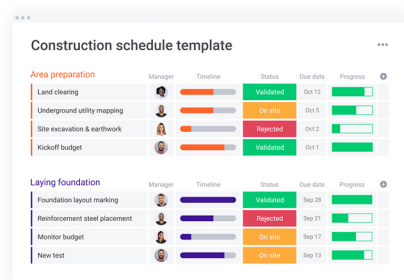

Next is procurement which is the most straightforward step in the construction process.

Procurement is simply the buying (or renting) of all the stuff needed for the construction project.

Like shopping for groceries for cooking a meal, you need all the ingredients and someone to use the ingredients.

In construction, that means finding the labor, equipment, and building materials.

This is where schedules can really get tied in a knot. You have a lot of varied delivery schedules and a lot of vendors you need to juggle so that the right materials get into the right people's hands at the right times.

Time to dig in the dirt, pour some concrete, bend some rebar, and fire up the welder. Now the project finally moves from paper (or more accurately, a CAD drawing) to the physical world.

But, this step has the most working parts and deadlines to coordinate. Each contractor and subcontractor involved must be on time and following plans for things to work.

Organization and communication are vital here, or you might have someone building a roof before the foundation is poured.

Creating project workflows for each team and stage of the process is essential, but (when you have as many dependencies as you do in the construction phase) it's even more necessary to keep everything working smoothly.

5

Construction

Post Construction

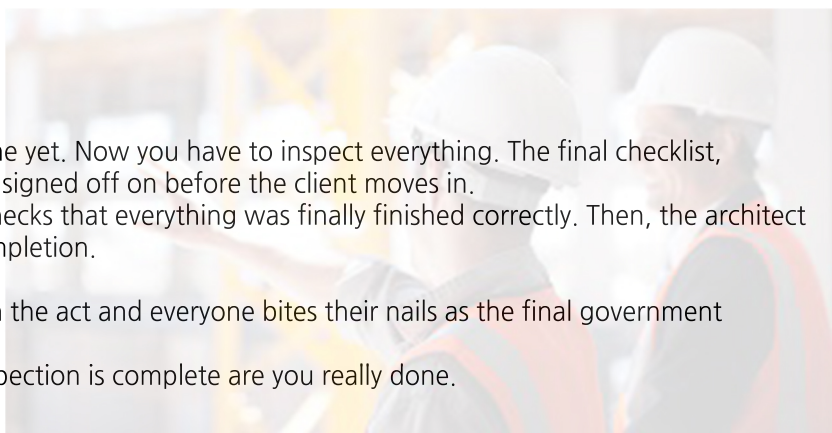

6

Everything is built but you aren't done yet. Now you have to inspect everything. The final checklist, called a project punch list, has to be signed off on before the client moves in.

That final walkthrough inspection checks that everything was finally finished correctly. Then, the architect issues a certificate of substantial completion.

Now, the government officials get in the act and everyone bites their nails as the final government inspection is done.

Only once that final government inspection is complete are you really done.
